Model checking - overview

- Sensibility with respect to additional information not used in modeling
 - e.g., if posterior would claim that hazardous chemical decreases probability of death

Model checking – overview

- Sensibility with respect to additional information not used in modeling
 - e.g., if posterior would claim that hazardous chemical decreases probability of death
- External validation
 - compare predictions to completely new observations
 - cf. relativity theory predictions

Model checking – overview

- Sensibility with respect to additional information not used in modeling
 - e.g., if posterior would claim that hazardous chemical decreases probability of death
- External validation
 - compare predictions to completely new observations
 - cf. relativity theory predictions
- Internal validation
 - posterior predictive checking
 - cross-validation predictive checking

Chapter 6

- 6.1 The place of model checking in applied Bayesian statistics
- 6.2 Do the inferences from the model make sense?
- 6.3 Posterior predictive checking
- 6.4 Graphical posterior predictive checks
 - this can be skimmed, see instead the paper Gabry et al. (2019). Visualization in Bayesian workflow https://doi.org/10.1111/rssa.12378
- 6.5 Model checking for the educational testing example

Model checking

- demo6_1: Posterior predictive checking light speed
- demo6_2: Posterior predictive checking sequential dependence
- demo6_3: Posterior predictive checking poor test statistic
- https://avehtari.github.io/BDA_R_demos/demos_rstan/brms_demo.html

Simon Newcomb's light of speed experiment in 1882

Newcomb measured (n = 66) the time required for light to travel from his laboratory on the Potomac River to a mirror at the base of the Washington Monument and back, a total distance of 7422 meters.

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$

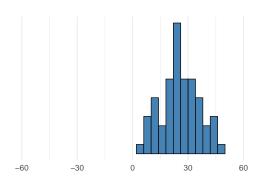

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$
- Posterior predictive replicate y^{rep}

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$
- Posterior predictive replicate y^{rep}
 - draw $\mu^{(s)}, \sigma^{(s)}$ from the posterior $p(\mu, \sigma|y)$

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$
- Posterior predictive replicate y^{rep}
 - draw $\mu^{(s)}, \sigma^{(s)}$ from the posterior $p(\mu, \sigma|y)$
 - draw $y^{\text{rep}(s)}$ from $\text{normal}(\mu^{(s)}, \sigma^{(s)})$

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$
- Posterior predictive replicate y^{rep}
 - draw $\mu^{(s)}, \sigma^{(s)}$ from the posterior $p(\mu, \sigma | y)$
 - draw $y^{\text{rep}(s)}$ from $\text{normal}(\mu^{(s)}, \sigma^{(s)})$
 - repeat *n* times to get y^{rep} with *n* replicates

- Newcomb's speed of light measurements
 - model $y \sim \text{normal}(\mu, \sigma)$ with prior $(\mu, \log \sigma) \propto 1$
- Posterior predictive replicate y^{rep}
 - draw $\mu^{(s)}, \sigma^{(s)}$ from the posterior $p(\mu, \sigma|y)$
 - draw $y^{\text{rep}(s)}$ from $\text{normal}(\mu^{(s)}, \sigma^{(s)})$
 - repeat n times to get y^{rep} with n replicates

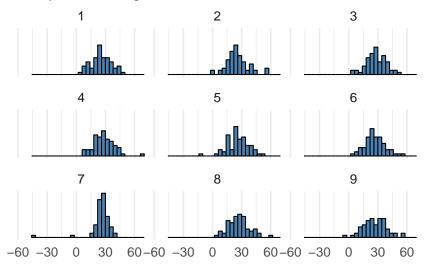

Replicates vs. future observation

Predictive ỹ is the next not yet observed possible observation.
 y^{rep} refers to replicating the whole experiment (potentially with same values of x) and obtaining as many replicated observations as in the original data.

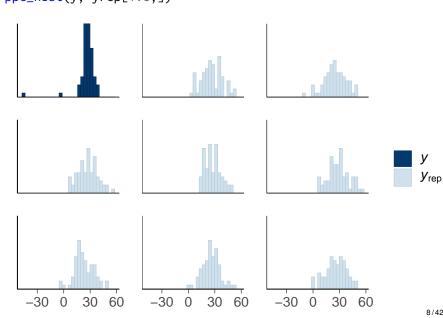

Generate several replicated datasets y^{rep}

- Generate several replicated datasets y^{rep}
- Compare to the original dataset

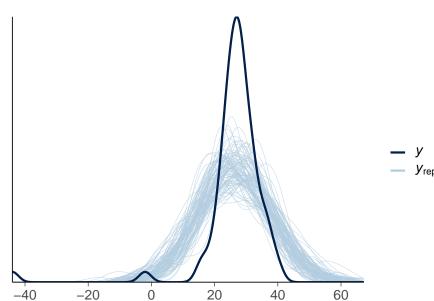

- Generate several replicated datasets y^{rep}
- Compare to the original dataset

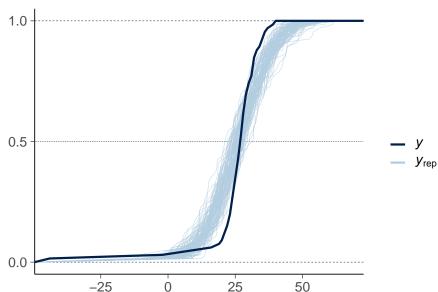

Posterior predictive checking – bayesplot ppc_hist(y, yrep[1:8,])

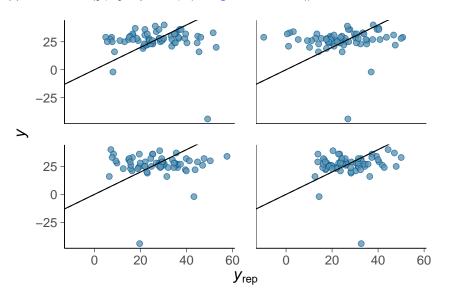

ppc_dens_overlay(y, yrep[1:100,])

ppc_ecdf_overlay(y, yrep[1:100,])

ppc_scatter(y, yrep[1:4,]) + geom_abline()

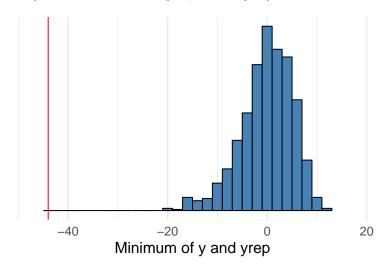

Posterior predictive checking with test statistic

- Replicated data sets y^{rep}
- Test quantity (or discrepancy measure) $T(y, \theta)$
 - summary quantity for the observed data $T(y, \theta)$
 - summary quantity for a replicated data $T(y^{rep}, \theta)$
 - can be easier to compare summary quantities than data sets

• Compute test statistic for data $T(y, \theta) = \min(y)$

- Compute test statistic for data $T(y, \theta) = \min(y)$
- Compute test statistic min(y^{rep}) for many replicated datasets

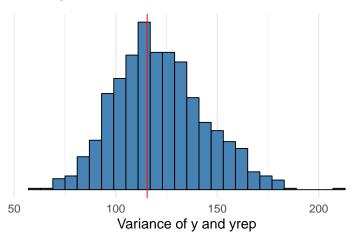

- Compute test statistic for data $T(y, \theta) = \min(y)$
- Compute test statistic min(y^{rep}) for many replicated datasets

- Good test statistic is (almost) ancillary (fi: aputunnusluku)
 - ancillary if it depends only on observed data and if its distribution is independent of the parameters of the model

- Good test statistic is (almost) ancillary (fi: aputunnusluku)
 - ancillary if it depends only on observed data and if its distribution is independent of the parameters of the model
- Bad test statistic is highly dependent of the parameters
 - e.g. variance for normal model

- Good test statistic is (almost) ancillary (fi: aputunnusluku)
 - ancillary if it depends only on observed data and if its distribution is independent of the parameters of the model
- Bad test statistic is highly dependent of the parameters
 - e.g. variance for normal model

Posterior predictive checking

Posterior predictive p-value

$$p = \Pr(T(y^{\text{rep}}, \theta) \ge T(y, \theta)|y)$$
$$= \int \int I_{T(y^{\text{rep}}, \theta) \ge T(y, \theta)} p(y^{\text{rep}}|\theta) p(\theta|y) dy^{\text{rep}} d\theta$$

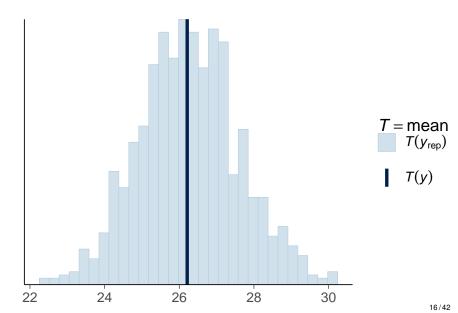

where I is an indicator function

• having $(y^{\text{rep }(s)}, \theta^{(s)})$ from the posterior predictive distribution, easy to compute

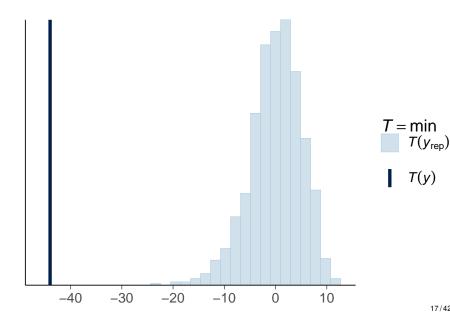

$$T(y^{\text{rep}(s)}, \theta^{(s)}) \ge T(y, \theta^{(s)}), \quad s = 1, \dots, S$$

- Posterior predictive p-value (ppp-value) estimates whether difference between the model and data could arise by chance
- Not commonly used, as
 - not calibrated in case of non-ancillary statistic
 - the distribution of test statistic has more information

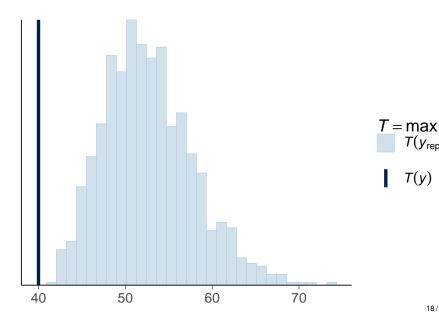

ppc_stat(y, yrep), the default statistic "mean" is usually bad

ppc_stat(y, yrep, stat="min")

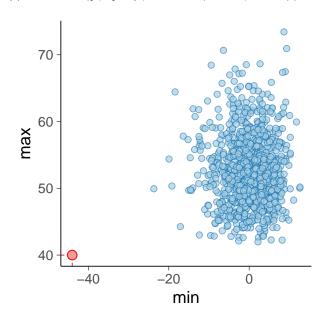

ppc_stat(y, yrep, stat="max")

 $T(y_{rep})$

T(y)

ppc_stat2d(y, yrep, stat=c("min", "max"))

 $T = (\min, \max)$

 $T(y_{\text{rep}})$

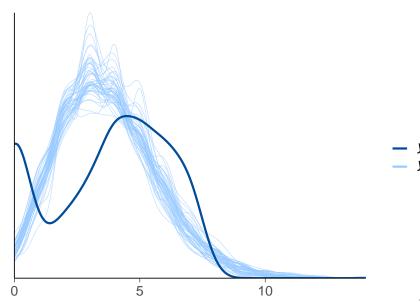

Posterior predictive checking - Stan code

demo demos_rstan/ppc/poisson-ppc.Rmd

```
data {
  int<lower=1> N;
  int<lower=0> y[N];
parameters {
  real<lower=0> lambda;
model {
  lambda ~ exponential(0.2);
  v ~ poisson(lambda);
generated quantities {
  real log_lik[N];
  int y_rep[N];
  for (n in 1:N) {
    y_rep[n] = poisson_rng(lambda);
    log_lik[n] = poisson_lpmf(y[n] | lambda);
```

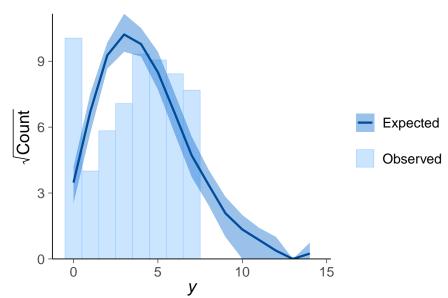

PPC for count data - Poisson model

ppc_dens_overlay(y, yrep[1:50,])

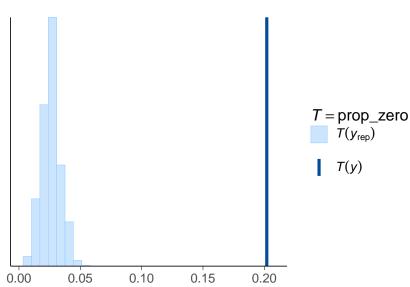

PPC for count data - Poisson model

ppc_rootogram(y, yrep)

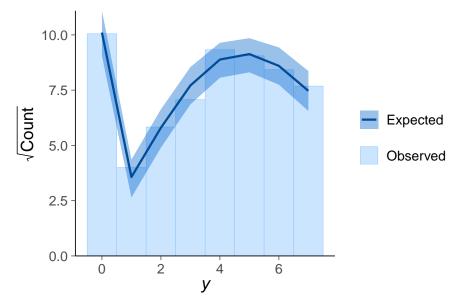

PPC for count data - Poisson model

```
prop_zero <- function(x) mean(x == 0)
ppc_stat(y, yrep, stat = "prop_zero")</pre>
```

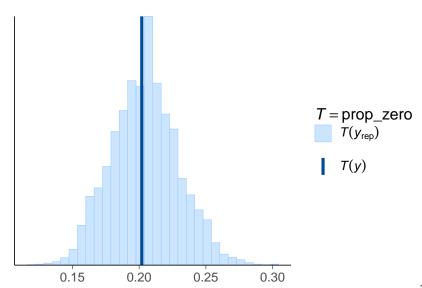

PPC for count data - hurdle truncated Poisson model

ppc_rootogram(y, yrep2)

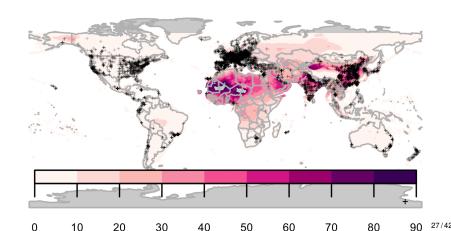

PPC for count data - hurdle truncated Poisson model

```
prop_zero <- function(x) mean(x == 0)
ppc_stat(y, yrep2, stat = "prop_zero")</pre>
```

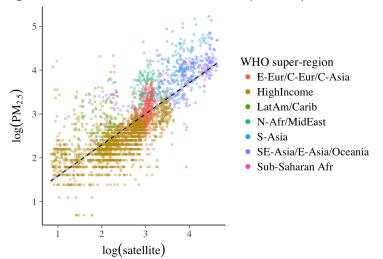

- Example from Jonah Gabry, Daniel Simpson, Aki Vehtari,
 Michael Betancourt, and Andrew Gelman (2019). Visualization in Bayesian workflow. https://doi.org/10.1111/rssa.12378
- Estimation of human exposure to air pollution from particulate matter measuring less than 2.5 microns in diameter (PM_{2.5})
 - Exposure to PM_{2.5} is linked to a number of poor health outcomes and a recent report estimated that PM_{2.5} is responsible for three million deaths worldwide each year (Shaddick et al., 2017)
 - In order to estimate the public health effect of ambient PM_{2.5}, we need a good estimate of the PM_{2.5} concentration at the same spatial resolution as our population estimates.

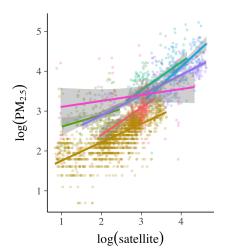

- Direct measurements of PM 2.5 from ground monitors at 2980 locations
- High-resolution satellite data of aerosol optical depth

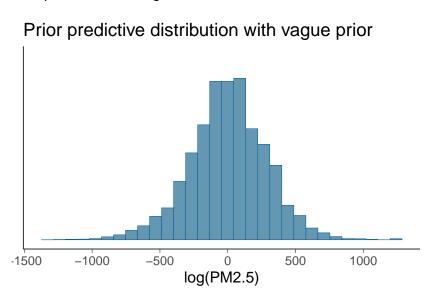

- Direct measurements of PM 2.5 from ground monitors at 2980 locations
- High-resolution satellite data of aerosol optical depth

 How much different choices in model structure and priors affect the results

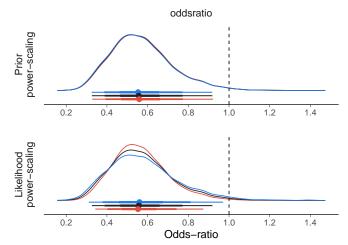

- How much different choices in model structure and priors affect the results
 - test different models and priors
 priorsense and adjustr packages use importance sampling
 for faster prior sensitivity analysis

- How much different choices in model structure and priors affect the results
 - test different models and priors
 priorsense and adjustr packages use importance sampling
 for faster prior sensitivity analysis
 - alternatively combine different models to one model
 - e.g. hierarchical model instead of separate and pooled
 - e.g. *t* distribution contains Gaussian as a special case
 - robust models are good for testing sensitivity to "outliers"
 - e.g. t instead of Gaussian

- How much different choices in model structure and priors affect the results
 - test different models and priors
 priorsense and adjustr packages use importance sampling
 for faster prior sensitivity analysis
 - alternatively combine different models to one model
 - e.g. hierarchical model instead of separate and pooled
 - e.g. *t* distribution contains Gaussian as a special case
 - robust models are good for testing sensitivity to "outliers"
 - e.g. t instead of Gaussian
- Compare sensitivity of essential inference quantities
 - extreme quantiles are more sensitive than means and medians
 - extrapolation is more sensitive than interpolation

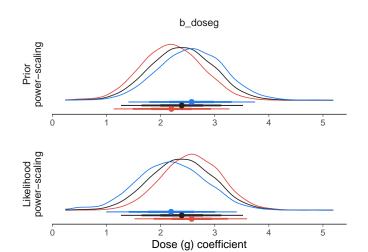

priorsense — prior and likelihood sensitivity analysis

- Power-scale prior and likelihood separately as $p(\theta)^{\alpha}$ and $p(y|\theta)^{\alpha}$
- Beta blockers randomized control-treatment experiment
 - no prior sensitivity
 - likelihood is informative

priorsense — prior and likelihood sensitivity analysis

- Power-scale prior and likelihood separately as $p(\theta)^{\alpha}$ and $p(y|\theta)^{\alpha}$
- Sorafenib Toxicity Binomial model meta analysis
 - prior-data conflict

priorsense — prior and likelihood sensitivity analysis

- Power-scale prior and likelihood separately as $p(\theta)^{\alpha}$ and $p(y|\theta)^{\alpha}$
- Sorafenib Toxicity Binomial model meta analysis
 - prior-data conflict
 - due to accidentally too narrow prior
